### **Physics Theory Answers For 2014**

Theoretical physics is a branch of physics that employs mathematical models and abstractions of physical objects and systems to rationalize, explain and predict natural phenomena. This is in contrast to experimental physics, which uses experimental tools to probe these phenomena. The advancement of science generally depends on the interplay between experimental studies and theory.

### **Theoretical physics - Wikipedia**

Some of the major unsolved problems in physics are theoretical, meaning that existing theories seem incapable of explaining a certain observed phenomenon or experimental result. The others are experimental, meaning that there is a difficulty in creating an experiment to test a proposed theory or investigate a phenomenon in greater detail. There are still some deficiencies in the Standard ...

I'm beginning to suspect that there are actually (at least) two different theoretical HEP physicists named Nima Arkani-Hamed out there. One of them (who I'll call Nima1) believes the way to understand the fundamental nature of physical reality involves extremely complicated extensions of the Standard Model, with large numbers of parameters tuned to avoid conflict with observation, and ...

Big Bang. The "big bang" is a story about how the universe came into existence. It proposes that billions of years ago the universe began in a tiny, infinitely hot and dense point called a singularity.

Do not be deceived: Leftism is an enigma. We need a theorem that explains not one or two aspects of Leftism, but all their traits. The theory must explain, first, the honest decency of the modern liberals combined with their astonishing indifference, nay, hostility to facts, common sense, and evidence; second, it must explain their high self-esteem (or, to be blunt, their pathological ...

Albert Einstein spent a lot of his career arguing against quantum theory. It seemed contradictory to everything we thought about physics. "One cannot make a theory out of a lot of 'maybes'" he once told a group of physicists.

While redshift can be used to tell us about the recession velocity of (non relativistic) galaxies, we also need to find a way to measure the distance to these galaxies. Astronomers have two main methods to measure these distances; parallax (more parallax here) and cepheid variable stars - there's a Khan Academy video on cepheid variable stars.
