According to ACI standards, the wet-mix strength should vary from 4,000 psi to 8,000 psi, and the dry-mix strength should vary from 4,500 psi to 9,000 psi. While, technically, dry-mix shotcrete can put out a stronger product because of the water-to-cement ratios, it does have more variables that can go wrong in the process.

The two basic methods for applying shotcrete are the dry-mix process and the wet-mix process. The term gunite is frequently used when referring to the dry-mix method; other terms such as air-placed concrete, gunned concrete and sprayed concrete have also been used in the past to describe the process.
